# Reverse-DNS stats from APNIC

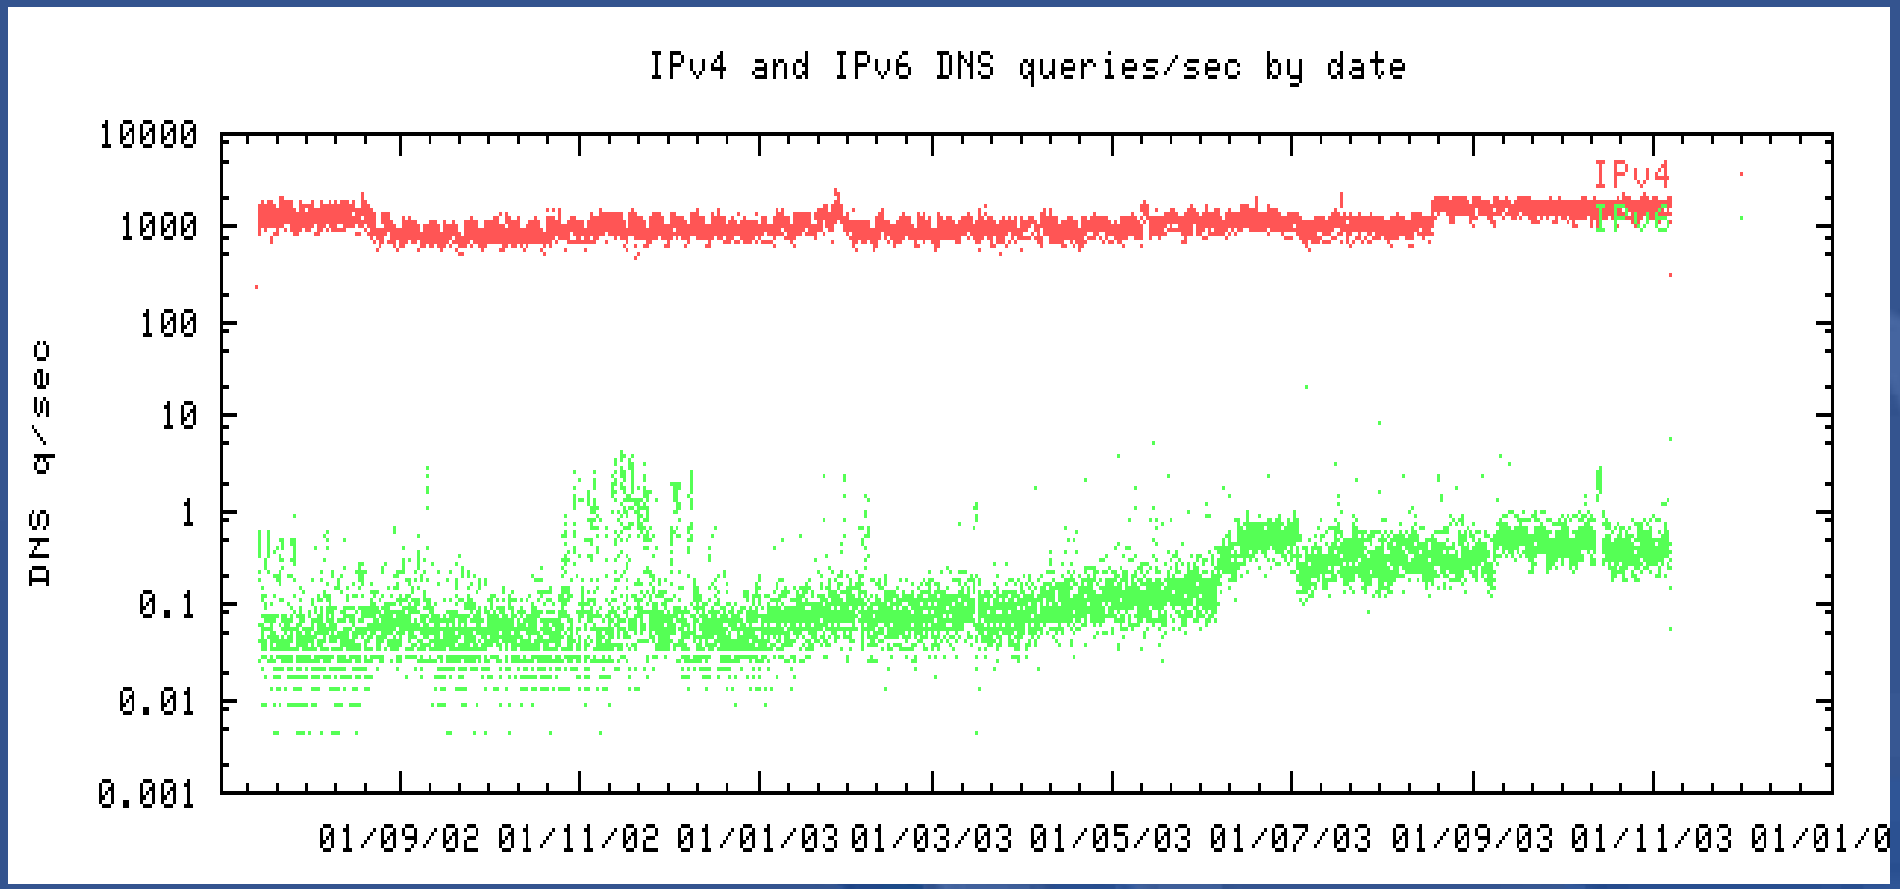
George Michaelson

ietf58-MN

# Methodology

- 1 min tcpdump sample, every 15 min 24/7
  - 2004 plan to deploy switch level port snarf
- Table of Assignment/Allocation to ccTLD
  - Known limitations to accuracy of 'source' attribution
- Measure {src,dst} ccTLD, volumes, types
  - Samples not retained
- 4 points of sample, in-addr.arpa NS hosts
  - 2 at Bne (1 to go), 1 JP, 1HK
    - Need to start monitoring secondary services

# Ipv4 & Ipv6 relative volume trends



# DNS view of 'attacks in the net?'
